

CSC331: Data Structures - BMCC Fall 2025
Professor Byron
Program #1 specifications: Hello Person
Due 1159pm Fri 9-19-2025
No credit received for late submission

Your task for this assignment is to run a C++ program using a personType class to display a message and capture the program output in a text file.

1. Implement a C++ program to display a message. The program should include (using the “include” statement) the personType.h header file provided in Brightspace. The program is to assign values for your first and last names in the personType object. The program should use object methods to display the message “hello, your name” on the console. Substitute your own name for “your name” in the message.
2. The program should be run from a command line prompt using redirection to save the program output in a text file. Your C++ program source file should be named csc331_section_prog1_lastname.cpp. Remember to substitute your own section for “section” and your own last name for “lastname”. Your saved output text file should be named csc331_section_prog1_lastname.txt. This command will run the program and redirect the program output to a text file: csc331_section_prog1_lastname > csc331_section_prog1_lastname.txt.
3. After the program is run, a full screen image capture showing the redirection should be saved. Capture the screen image using the “print screen” function on your keyboard. Paste the captured image onto a Word doc file named csc331_section_prog1_lastname.doc. Above the image, include comments containing the course ID and section, assignment number, your full name, the document title and the program due date. A sample report containing a screen image capture can be found on Brightspace.
4. Your C++ source program should contain comments starting on line 1 of the program containing the course ID and section, your full name, the program file name, the program due date and the program purpose. Programmers are always encouraged to add additional comments throughout the program that might be helpful to the reader of your source code.
5. Submit your C++ program source file (i.e., cpp file), your output text file and your Word DOC file as separate, unzipped attachments of an email message to kbyron@bmcc.cuny.edu. Use this email subject form: “csc331_section_prog1_lastname”. A link to a file located on a remote server will not be accepted. If you submit your assignment one week early, it will be graded. If you wish, you may then re-submit your complete assignment prior to the due date for a potentially higher score.
6. Do your own work. All students submitting copies of the same program will receive grades of zero for the assignment and may be referred to the Dean of Students, as described in the BMCC plagiarism policy.
